

ALA:-1

Explain:-

Here is the explanation **without symbols and emojis**, in simple format.

Your code had these errors:

1. Missing colon

After writing if, else, and for, you must put a colon.

Example:

if age >= 18:

else:

for i in range(3):

Without colon, Python gives SyntaxError.

2. No indentation

After if, else, and for, the next line must have space (indentation).

Example:

```
if age >= 18:
```

```
print("Eligible")
```

If you do not give space, Python gives IndentationError.

3. Comparing string with number

input() always gives text (string).

You cannot compare text with number.

Wrong:

```
age = input("Enter age: ")
```

```
if age >= 18:
```

Correct:

```
age = int(input("Enter age: "))
```

This converts text to integer.

4. Wrong variable name

You wrote Name but declared name.

Python is case-sensitive.

name and Name are different.

Correct:

```
print("Voter:", name)
```

These are the errors in your program.
